

Neurons: Agree or Disagree?

Objective: Review the parts of neurons.

How to play: Students use the PearDeck application to move their dot to display whether they agree or disagree with the statement read aloud.

Statements:

The three main parts of a neuron are the cell body, dendrites, and myelin sheath (disagree; should be axon instead of myelin sheath)

The place where the axon terminal of one neuron meets an axon of another neuron is called the synapse (disagree; should be meets a dendrite of another neuron)

The nucleus is inside of the cell body (agree)

Myelin sheath cells slow down the electrical signals sent through neurons (disagree; should be that they increase the speed of the electrical signals)
